

# Yocto Project® devtool Overview and Hands-On

Saul Wold, Windriver (with material by Trevor Woerner & Paul Eggleton)

**Yocto Project Summit 2022.05** 

#### devtool

- Collection of tools for working on recipes:
  - devtool add
  - devtool edit-recipe
  - devtool upgrade
  - devtool finish
  - etc...

#### devtool

- ...and more!
  - devtool modify
  - devtool deploy-target
  - devtool undeploy-target
  - devtool build
  - devtool build-image
  - etc...

# devtool – why it exists

- Our build system is great for repeatable builds from source
- Working with the source itself was hard
  - Tempting to just edit sources under tmp/work/...
  - But workflow is painful after that (forced builds, manual patch generation, lost work...)
- Help newer users add new software (alongside regular build and within eSDK)

# devtool – past presentations

```
$ devtool --help
usage: devtool [--basepath BASEPATH] [--bbpath BBPATH] [-d] [-q]
               [--color COLOR] [-h]
              <subcommand> ...
OpenEmbedded development tool
options:
  --basepath BASEPATH Base directory of SDK / build directory
  --bbpath BBPATH
                      Explicitly specify the BBPATH, rather than getting it
                      from the metadata
  -d, --debug
                      Enable debug output
  -q, --quiet
                      Print only errors
  --color COLOR
                      Colorize output (where COLOR is auto, always, never)
  -h, --help show this help message and exit
subcommands:
  Beginning work on a recipe:
   add
                       Add a new recipe
. . .
```

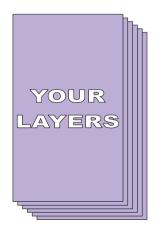

. . .

```
$ devtool add --help
usage: devtool add [-h] [--same-dir | --no-same-dir] [--fetch URI]
                   [--fetch-dev] [--version VERSION] [--no-qit]
                   [--srcrev SRCREV | --autorev] [--srcbranch SRCBRANCH]
                   [--binary] [--also-native] [--src-subdir SUBDIR]
                   [--mirrors] [--provides PROVIDES]
                   [recipename] [srctree] [fetchuri]
Adds a new recipe to the workspace to build a specified source tree. Can
optionally fetch a remote URI and unpack it to create the source tree.
arguments:
  recipename
                        Name for new recipe to add (just name - no version,
                        path or extension). If not specified, will attempt to
                        auto-detect it.
  srctree
                        Path to external source tree. If not specified, a
                        subdirectory of /z/ypdd/2018-10-devtool/my-
                        class/poky/build/workspace/sources will be used.
  fetchuri
                        Fetch the specified URI and extract it to create the
                        source tree
options:
                        show this help message and exit
  -h, --help
```

# devtool - workspace

 a separate environment (layer) in which to work on recipes, sources, patches

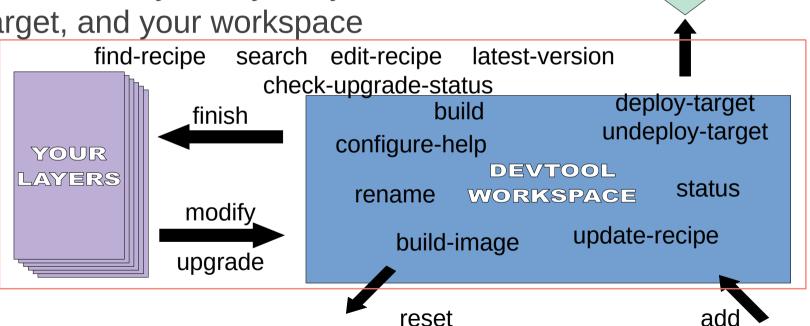

# devtool – workspace (bitbake mode)

 how the various devtool commands relate to the your layers, your target, and your workspace

TARGET

# devtool – multiple targets?

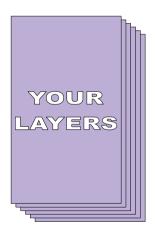

# devtool - multiple targets?

- yes
- specify target's IP with un/deploy-target

# Sidebar: recipetool

- Extra set of tools for working on recipes
- Contains logic for creating recipes (used by devtool add)
- Can also create/update bbappends, programmatically set variables in recipes, etc.

# Questions?

# **Hands On**

# devtool - setup

#### nano ~/.ssh/config

```
Host qemu
User root
Hostname localhost
Port 2222
StrictHostKeyChecking no
UserKnownHostsFile /dev/null
```

### devtool - setup

```
bitbake-layers create-layer meta-foo
bitbake-layers add-layer meta-foo
git config --global user.name "name"
git config --global user.email "name@example.com"
```

open a second ssh connection to the build machine

```
source ~/poky/oe-init-build-env ~/build-devtool runqemu slirp nographic serial
```

- do the exercises in the first connection, work on the target in the second connection
- login as "root", no password (thanks to "debug-tweaks")

# devtool - getting started

```
devtool add \
  https://nano-editor.org/dist/v6/nano-6.2.tar.xz
```

- implicitly creates workspace (if it doesn't already exist)
- guesses the recipe name nano (correctly!)
- looks at the source and determines it's an autotooled project (true! and pkgconfig and gettext)
- guesses at DEPENDS (correctly! Ncurses, file and zlib)
- creates a "rough" recipe

```
devtool status
devtool find-recipe nano
devtool edit-recipe nano
```

# devtool – getting started

let's see if it builds

devtool build nano

• it builds!

# devtool – what goes in a workspace?

- the things on which you are working:
  - recipes
  - patches
  - sources
  - etc...

tree -d workspace

• ...except sources can be, optionally, outside the workspace

#### devtool – let's see nano run

- examine tmp/deploy/images/qemuarm64/core-image-base-qemuarm64.manifest
  - verify there's no "nano" package
- in the terminal running qemu, log in and verify there's no nano

```
root@qemuarm64# nano
-sh: nano: command not found
```

send nano to target

devtool deploy-target nano qemu

now nano runs

### sidebar - SLIRP versus TUN/TAP

 Yocto Project supports several connection technologies for QEMU qemu is defined in
 ~/.ssh/config
 (see earlier slide)

• SLIRP: advantage is no root access required, disadvantages are minimal documentation, requires SSH knowledge, ICMP (e.g. ping) not available by default

```
2$ runqemu slirp nographic serial
$ devtool deploy-target nano qemu
```

• TAP: advantage is simpler setup, disadvantage is that it requires sudo access

```
2$ sudo runqemu nographic serial $ devtool deploy-target nano root@192.168.7.2
```

#### devtool – let's see nano run

build an entire image

```
$ devtool build-image core-image-base
...
NOTE: Building image core-image-base with the following additional
packages: nano
...
```

- examine tmp/deploy/images/qemuarm64/core-image-base-qemuarm64.manifest
  - now there is a nano package
- why not just use "bitbake core-image-base"?
  - nano package not automatically added

try upgrading nano

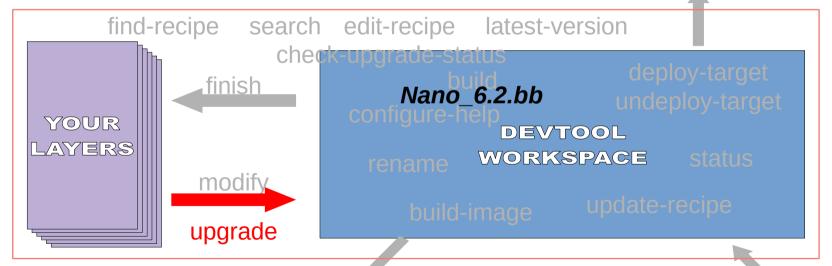

```
$ devtool upgrade nano
ERROR: recipe nano is already in your workspace
```

- we need to move the *nano* recipe to *Your Layers* before we can *upgrade*
  - preferably our own (meta-foo)
- this is only an issue because nano is in the workspace already – normally devtool upgrade is where you start an upgrade for an existing recipe

 we can't upgrade a recipe that is already in the workspace

TARGET

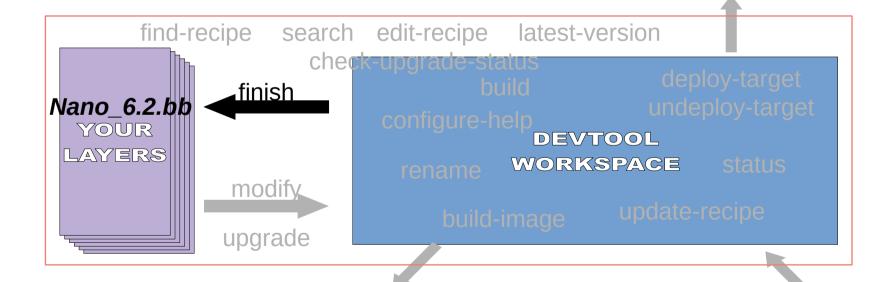

an upgrade must come from your layers

add

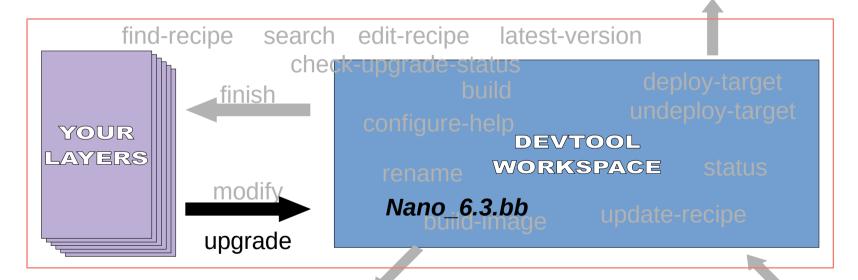

first we need to finish

then we can upgrade

```
$ devtool finish nano meta-foo
ERROR: Source tree is not clean:
...
```

 this error is not a problem we introduced; it is a nanospecific issue – but we need to tell devtool it's OK with -f

```
$ devtool finish -f nano meta-foo
INFO: No patches or files need updating
INFO: Moving recipe file to .../meta-foo/recipes-nano/nano
INFO: Leaving source tree .../build-devtool/workspace/sources/nano as-is; if you
no longer need it then please delete it manually
```

 it is worth noting that it will not remove the sources; we need to do it explicitly

```
$ rm -fr workspace/sources/nano
```

```
$ devtool upgrade nano
...
```

 In some cases devtool can't figure out how to find and upgrade tarballs (this information is not obvious from the URL)

we need to give devtool more help

```
$ devtool upgrade -V 6.3 nano
```

• it works!

```
$ devtool build nano
```

• it builds!

# devtool deploy-target - dive in

- is it okay to re-deploy a second time without cleaning up the first deploy?
  - yes... usually
- on the target

```
root@qemuarm64# cd /
root@qemuarm64# ls -a
...
.devtool
...
root@qemuarm64# cd .devtool
root@qemuarm64# ls -l
-rw-r--r-- 1 root root 4969 Oct 20 06:03 nano.list
```

# devtool deploy-target - dive in

- nano.list is created by devtool, per package, when it deploys to the target
- examine poky/scripts/lib/devtool/deploy.py for all the answers
  - it creates a script that is copied to target
  - preserves any files that would be clobbered
  - generates a list of files being deployed, so they can be undeployed
  - deploying starts by undeploying (same recipe name)

# devtool deploy-target - dive in

 undeploy, and verify nano is removed from target, and the plumbing is also removed

```
$ devtool undeploy-target nano qemu
root@qemuarm64# ls -a /
```

remember to finish and cleanup

```
$ devtool finish -f nano ../meta-foo
$ rm -fr workspace/sources/nano
```

## devtool - floating devtool commands

 some devtool commands don't care whether the recipe is in the workspace or the layers

```
$ devtool status
NOTE: No recipes currently in your workspace
$ devtool edit-recipe ethtool
(works)
$ devtool latest-version ethtool
NOTE: Current version: 5.10
NOTE: Latest version: 5.10
$ devtool find-recipe ethtool
$ devtool search ethtool
```

- use-case? patches can be needed to
  - add/remove functionality
    - reduce size on target
    - remove dependency/dependencies
  - allow code to be (cross-)compiled

```
$ devtool add https://github.com/twoerner/autotool-devtool-
example/archive/v1.0.0.tar.gz
$ devtool build autotool-devtool-example
$ devtool deploy-target autotool-devtool-example qemu
```

```
root@qemuarm64# autotool-devtool-example
Hello, world!
version: 1.0.0
Hello from the library
```

edit the code

```
$ pushd workspace/sources/autotool-devtool-example
$ nano src/autotool-devtool-example.c
```

change from

```
printf("Hello, world!\n");
```

to

```
printf("Hello, devtool!\n");
```

build, deploy, verify

```
$ popd
$ devtool build autotool-devtool-example
$ devtool deploy-target autotool-devtool-example qemu
```

```
root@qemuarm64# autotool-devtool-example
Hello, devtool!
version: 1.0.0
Hello from the library
```

cleanup

```
$ devtool finish autotool-devtool-example meta-foo
ERROR: Source tree is not clean:
M src/autotool-devtool-example.c
```

oops! but it's nice it didn't clobber or lose my work

```
$ pushd workspace/sources/autotool-devtool-example
$ git commit -avs
...
$ popd
$ devtool finish autotool-devtool-example meta-foo
...
INFO: Adding new patch 0001-update-salutation.patch
...
$ rm -fr workspace/sources/autotool-devtool-example
```

## devtool - creating conflict

 now we'll update to a newer release, but the newer release will conflict with our patch

```
$ devtool upgrade autotool-devtool-example
...

Connecting to github.com (github.com)|192.30.253.113|:443...
connected.

HTTP request sent, awaiting response... 404 Not Found
2018-10-20 12:16:11 ERROR 404: Not Found.

ERROR: Automatic discovery of latest version/revision failed - you
must provide a version using the --version/-V option, or for
recipes that fetch from an SCM such as git, the --srcrev/-S option.
```

devtool can't figure it out, we need to help it

#### devtool - creating conflict

```
$ devtool upgrade -V 1.0.1 autotool-devtool-example
WARNING: Command 'git rebase cdb5e8e1d76e5022ae754ea95dc5e4cf85af7670' failed:
First, rewinding head to replay your work on top of it...
Applying: update salutation
Using index info to reconstruct a base tree...
       src/autotool-devtool-example.c
Falling back to patching base and 3-way merge...
Auto-merging src/autotool-devtool-example.c
CONFLICT (content): Merge conflict in src/autotool-devtool-example.c
error: Failed to merge in the changes.
Patch failed at 0001 update salutation
The copy of the patch that failed is found in: .git/rebase-apply/patch
When you have resolved this problem, run "git rebase --continue".
If you prefer to skip this patch, run "git rebase --skip" instead.
To check out the original branch and stop rebasing, run "git rebase --abort".
You will need to resolve conflicts in order to complete the upgrade.
```

- keep the new, or keep the old?
  - keep the new
  - \$ pushd workspace/sources/autotool-devtool-example
  - \$ nano src/autotool-devtool-example.c

from

```
13 <<<<<< HFAD
          /* a meaningful comment */
14
           printf("Hello, world!\n");
15
   |||||| merged common ancestors
17
           printf("Hello, world!\n");
19
           printf("Hello, devtool!\n");
20 >>>>> update salutation
```

to

```
13  /* a meaningful comment */
14  printf("Hello, devtool!\n");
```

```
$ git add src/autotool-devtool-example.c
$ git rebase --continue
Applying: update salutation
$ popd
```

This time, let's inspect recipe updates first with -N:

```
$ devtool finish autotool-devtool-example meta-foo -N
```

If we're happy with the proposed changes, apply them:

```
$ devtool finish autotool-devtool-example meta-foo
```

```
$ devtool finish autotool-devtool-example meta-foo
$ tree meta-foo
../meta-foo/
    recipes-nano
        nano
        — nano 4.3.bb
    recipes-autotool-devtool-example
    — autotool-devtool-example
            autotool-devtool-example
            — 0001-update-salutation.patch
            autotool-devtool-example 1.0.1.bb
```

## devtool - modify

- 1) takes an existing recipe from layers
- 2) unpacks sources into workspace
- 3) edit recipe or sources
- 4) ... (same as devtool add/devtool upgrade workflow)

## devtool modify example

```
$ devtool modify bc
INFO: Source tree extracted to /home/ilab01/yp-summit-may-21/poky/build-
devtool/workspace/sources/bc
INFO: Recipe bc now set up to build from
/home/ilab01/yp-summit-may-21/poky/build-devtool/workspace/sources/bc
$ devtool edit-recipe bc
```

Take a note of file://libmath.h in SRC\_URI, then exit and continue

```
$ pushd /home/ilab01/build-devtool/workspace/sources/bc
$ ls
aclocal.m4 compile
                 COPYING.LIB
                                          Makefile.am
                                FA0
                                                        README
ar-lib
         config.h.in
                    dc
                                          Makefile.in
                                                       Test
                                INSTALL missing

ChangeLog COPYING
                     Examples lib oe-local-files
$ ls oe-local-files
libmath.h
```

#### devtool modify example

• Edit bc/main.c and make a trivial change to the help text printed in usage() (line 69)

```
$ nano bc/main.c
```

Commit changes and run devtool finish

```
$ git add bc/main.c
$ git commit -s
$ popd
 devtool finish bc meta-foo
NOTE: Writing append file /home/ilab01/yp-summit-may-21/poky/meta-
foo/recipes-extended/bc/bc %.bbappend
NOTE: Copying 0001-Change-help-text.patch to /home/ilab01/yp-
summit-may-21/poky/meta-foo/recipes-extended/bc/bc/0001-Change-
help-text.patch
```

## devtool modify example

- devtool finish realised the bc recipe is not in meta-foo
  - Thus it created a bbappend and placed the patch next to it
  - Naturally if we had passed the path to poky/meta it would have modified the original recipe

# Wrap up

#### devtool - eSDK Mode

- the eSDK includes many improvements over the standard SDK
- everything the standard SDK can do, plus all of the functionality we've been looking at that is provided by devtool

#### devtool - mode commands

#### bitbake mode

- add
- build
- build-image
- configure-help
- check-upgrade-status
- create-workspace
- deploy-target
- edit-recipe
- export
- extract
- find-recipe
- finish
- import
- latest-version
- menuconfig
- modify
- rename
- reset
- search
- status
- sync
- · undeploy-target
- · update-recipe
- upgrade

#### eSDK mode

- add
- build
- build-image
- build-sdk
- configure-help
- check-upgrade-status
- · deploy-target
- · edit-recipe
- export
- extract
- find-recipe
- finish
- import
- latest-version
- menuconfia
- modify
- package
- rename
- reset
- rungemu
- sdk-install
- sdk-update
- · search
- status
- sync
- undeploy-target
- update-recipe
- upgrade

#### devtool - mode commands

- why does eSDK mode get extra features?
  - because an eSDK doesn't have bitbake or scripts/
  - *devtool* is the cornerstone of the eSDK

#### **Future**

- Multiconfig support
- Recipe modification fixes
- recipetool enhancements (make devtool add smarter)
- Your idea here :)
  - Help very much welcome!

#### **Conclusion**

- Try it out on your own sources / recipes:
  - devtool add on a source tree / tarball / URL
  - devtool modify and work on an existing recipe
  - devtool upgrade existing recipe to a new upstream version
- See documentation links & other presentations (earlier slide)

#### **Conclusion**

- Please send feedback!
